PROFESSIONAL SUMMARY

Algorithmic Trading Developer with 2+ years of experience building low-latency, multi-threaded Python systems for real-time market data processing and automated trading. Experienced in designing, backtesting, and deploying systematic options and futures strategies with end-to-end execution, risk management, and monitoring, achieving sub-100ms execution latency and 99.9% uptime. Seeking backend, quant, or trading engineering roles focused on scalable real-time systems and automation.

CORE COMPETENCIES

Programming & Databases: Python, SQL, Flask
Quantitative & Trading Systems: Backtesting, Risk Management, Options & Futures Trading, Market Data Processing
Real-Time & Backend Systems: WebSockets, REST APIs, Multithreading, Event-Driven Architecture, Low-Latency Applications
Data Analysis: Pandas, NumPy, Power Query, Advanced Excel
Data Visualization: Power BI, Tableau, Matplotlib
Development & AI Tools: Gemini CLI (Antigravity), Prompt Engineering, Automation

EXPERIENCE

Algorithmic Trading Developer — UVFarms | Nov 2023 – Present

- Engineered a low-latency Python trading framework processing real-time WebSocket market data for NIFTY and SENSEX derivatives, achieving sub-100ms execution with 99.9% uptime across live trading sessions.
- Designed and deployed 6+ algorithmic trading strategies using VWAP, SuperTrend, Parabolic SAR, CPR, and ATR across 1–5 minute timeframes.
- Automated trade execution through Dhan and Flattrade APIs, reducing manual intervention by 95% and eliminating order placement errors.
- Built real-time monitoring dashboards to track P&L, drawdown, and risk metrics with automated alerting systems.
- Developed a structured backtesting framework with historical data validation and performance analytics for pre-deployment strategy optimization.

KEY PROJECTS

Super SAR Option Scalping (Dec 2025–Feb-2026)

- Architected and deployed Super-SAR-Option v6.0, a production-grade multi-threaded algorithmic system for live NIFTY/SENSEX options trading with independent Flask dashboard, 1-second trading loop, and 5-second indicator sync for minimal latency.
- Engineered rule-based strategy combining Heikin Ashi momentum, Parabolic SAR, SuperTrend (dual timeframes), and VWAP with market structure analysis for peak/valley identification and dynamic resistance filtering.
- Built end-to-end backtesting and paper-trading pipeline with automated ATM strike selection, 10-point targets, 30-point stops, and validation across volatility regimes before live deployment.
- Developed real-time monitoring dashboard with live P&L tracking, signal timestamps, API latency metrics, and system health alerts for rapid decision-making.

NanoProfits AI (Sep–Dec 2025)

- Designed multi-threaded algorithmic trading engine processing real-time WebSocket market data with sub100ms execution latency and 99.9% uptime during market hours through automated monitoring and recovery mechanisms.
- Engineered PostgreSQL connection-pooled data layer for high-throughput tick-level logging, ensuring 100% data persistence for trade auditing and post-trade analytics.
- Built pullback-based scalping strategy using resampled 3-min/5-min OHLC with VWAP, SuperTrend, and ATR indicators, incorporating volatility-adjusted exits and dynamic position sizing for improved risk control.
- Developed HTML monitoring dashboard tracking system health (RAM, disk, network, latency) and implemented dual-layer authentication JWT for uninterrupted API token management.

UVFarms Official Website

- Built and deployed a production-ready, responsive multi-page website for nine agri-tech verticals, ensuring scalable architecture, optimized performance, and seamless cross-device experience.
- Utilized Gemini CLI (Antigravity) with structured prompt engineering workflows to accelerate development, automate content generation, and enhance UI/UX design decisions.

  Tech Stack: Next.js, React, Gemini CLI (Antigravity), Responsive Design, Prompt Engineering
