SUMMARY

Innovative Algorithmic Trading Developer with 1 year of experience in constructing robust trading frameworks. Developed a Python-based low-latency trading system achieving sub-100ms execution latency, deployed 6+ strategies enhancing execution consistency by 95%. Seeking to leverage proficiency in algorithmic strategy development and API automation to advance quantitative performance and trade oversight.

EXPERIENCE

Algorithmic Trading Developer

UVFarms **December 2024 - Present, Chennai**

- Completed a 3-month trainee program in financial markets, derivatives trading, and algorithmic strategy development, gaining hands-on exposure to live trading systems and workflows.
- Built a Python-based low-latency trading framework processing real-time WebSocket data for NIFTY and SENSEX derivatives, achieving **sub-100ms execution latency** across live sessions.
- Developed and deployed **6+ algorithmic trading strategies** using VWAP, SuperTrend, Parabolic SAR, CPR, and ATR across **1–5 minute timeframes**, improving signal accuracy and execution consistency.
- Automated end-to-end trade execution via Dhan and Flattrade APIs, reducing manual intervention by **95%** and eliminating order placement errors.
- Designed real-time monitoring dashboards tracking **P&L, drawdown, and risk metrics**, with automated alerts improving risk response time and trade oversight.
- Built a backtesting and analytics framework to validate strategies on historical data, improving strategy performance and reducing live trading risk prior to deployment.

PROJECT

Options Trading Bot

UVFarms • February 2026 - Present

- Developed an automated algorithmic trading bot for index options, processing **real-time data streams with <150ms latency** via WebSocket and REST APIs.
- Built tick-by-tick indicator engine (VWAP, ATR) handling **100+ ticks per minute**, enabling real-time signal generation and adaptive risk control.
- Implemented strategy logic using VWAP and SuperTrend across **1–5 minute timeframes**, improving entry precision and trade consistency.
- Designed order execution and management system supporting **low-latency trade placement and real-time position tracking across multiple contracts**.
- Integrated paper and live trading modes, enabling **100+ simulated trades for validation** before live deployment.
- Engineered a modular analytics dashboard that visualized live trading metrics, aggregated historical performance, and supported rapid strategy refinement for continuous system optimization.

SUPER-SAR Option Trading System

UVFarms • December 2025 - February 2026

- Built a multi-threaded algorithmic options trading system for BSE, supporting **real-time monitoring of 10+ option strikes** and automated ATM selection.
- Achieved **sub-100ms execution latency** and **99.9% uptime** using concurrent processing, thread-safe state management, and automated monitoring.
- Developed a pullback-based trading strategy using VWAP, SuperTrend, Parabolic SAR, and ATR across **3–5 min timeframes**, improving signal consistency and execution timing.
- Implemented risk controls including **ATR-based stop-loss, structural exits, and emergency kill-switch**, reducing potential drawdowns and preventing runaway losses.
- Designed a modular architecture with **5+ independent components** (data ingestion, strategy engine, execution, risk, audit), enabling scalability and maintainability.
- Built a Flask-based dashboard tracking **real-time P&L, latency, and system health metrics**, supporting both live and paper trading modes.

NanoProfits AI

UVFarms • September 2025 - December 2025

- Designed a multi-threaded Python trading engine processing real-time market data with **sub-100ms execution latency** and **99.9% uptime** during live market sessions.
- Built a PostgreSQL connection-pooled data layer for **tick-level logging**, ensuring **100% data persistence** for trade auditing and post-trade analysis.
- Developed a pullback-based scalping strategy using **3–5 min OHLC data** with VWAP, SuperTrend, and ATR indicators, incorporating volatility-based exits and dynamic position sizing for risk management.

- Created a real-time monitoring dashboard to track **system health metrics** (RAM, disk, network, latency), improving system observability and failure detection.
- Implemented JWT-based authentication for secure API session management, ensuring uninterrupted and protected trading operations.

EDUCATION

Bachelor of Commerce - Information Systems Management

SRM Institute of Science and Technology (SRMIST) • Ramapuram, Chennai, Tamil Nadu, India • 2023 • 7.83

- Studied an interdisciplinary curriculum at SRM Institute of Science and Technology combining finance, accounting, and economics with information systems, databases, and data analysis.
- Built a strong foundation in financial systems and data-driven decision-making through coursework in Financial Accounting, Database Management Systems, Management Information Systems, and Business Statistics.
- Developed an interest in financial technology and algorithmic trading, applying technical and analytical skills to design systems for market data analysis and automated trading strategies.

SKILLS

Hard Skills: Algorithmic Trading, Backtesting, Risk Management, Options & Futures Trading, Market Data Processing, Quantitative Strategy Development, Financial Analysis

Technical Skills: Python, SQL, Flask, PostgreSQL, WebSockets, REST APIs, Multithreading, Event-Driven Architecture, Low-Latency Systems, NumPy, Pandas, Power BI, Tableau, Matplotlib, Next.js, React, ZeroMQ

Soft Skills: Analytical Thinking, Problem-Solving, Attention to Detail, Adaptability, Communication
